

Connection in construction

Successful operations and quality standards...

The positive geo-strategic position of Slovenia has, in terms of goods and passenger transit, always represented an advantage to our country, and thus provided exceptional connections between companies and their subsidiaries from our former country and Central Europe. Our railway construction company has good business relationships, and is closely bound to all branches of new construction, renovation and reconstruction of railway tracks. There are no language barriers among nations living in this area; the good business relationships are actually the result of a long tradition living under the same flag.

Constructing new, and reconstructing and maintaining existing railway tracks

With regard to projects concerning new constructions, renovations and reconstructions of railway corridors, we represent an important link between interested and competent parties from Europe, and the local structure of contractors who want to participate in public tenders, where, often due to their level, the terms are hard to achieve.

Our advantage lies in the qualification to perform construction on railway infrastructure with a high level of technical knowledge and equipment

Being acquainted with the specific legal requirements and meeting those requirements in terms of the whole track mechanisation equipment enables us to work in all countries of South West

Europe and the Balkans. The procedure of acquiring the working licence for these infrastructure systems can therefore be very efficient and simple. The work performance technology and traffic regulation regarding railway transport originate from the same transport and technical regulations that were once in force in the former country.

We have acquired the option of co-operating on projects of reconstruction of tramways in Belgrade, where we will participate with our own bids. In addition, we have also acquired the option of performing works of reconstruction in Bosnia and Herzegovina. We are prepared for new important investment cycles for railway infrastructure reconstruction, which will be financed from the European funds. We look into the future, full of optimism and confidence.

We are convinced of our success. Optimism and confidence in our own abilities are and will be the driving force

of future development. Successful operations and quality standards are, for many years, defined in the certificate ISO 9001:2000, and are the cornerstones on which we will continue to build and improve our company – ŽGP (Railway Construction Company).
